representations/ covering groups

Geometry

Geometry is the study of figures, which are technically called manifolds.

Differential geometry is the field of the precise study of the shape of manifolds, using cues such as curvature and the behaviour of geodesics of (Riemannian) manifolds. Here geodesics are generalisations of straight lines in Euclidean space. On the other hand, topology is the field of the study of topological properties of manifolds by mapping algebraic invariants onto them.

The basic algebraic invariants, for instance, are fundamental groups, homotopy groups, homology groups and cohomology groups.

Nonlinear PDE

Assoc. Prof. UEHARA Takato

■ Research Themes
complex analysis/dynamical system

Mathematical Analysis

Research Area "Mathematical Analysis" is devoted to theory on partial differential equations, theory of probability, functional analysis, dynamical systems and statistics.

For theory on partial differential equations, we study multi-dimensional traveling fronts appearing in reaction-diffusion models in physics, chemistry and biology. For theory of probability, we study stochastic partial differential equations and their discrete models.

Taniguchi/Taguchi Group

Research Sector of Mathematical Analysis

- Nonlinear Partial Differential Equations (Prof. M. Taniguchi)
- Stochastic Differential Equations (Prof. D. Taguchi)

Prof. M. Taniguchi

Prof. D. Taguchi

Quantum Structural Physics in Correlated Matter

In recent years, it is known that topological insulators, topological semimetals, etc. undergo large physical property changes in small electric and magnetic fields, related to the even-oddity of wave functions and bands. However, its creation requires control of the Fermi surface, control of spin-orbit interaction, and control of space and time reversibility. We create and study pure topological materials by means of quantum structural physics.

Low Temperature Condensed Matter Physics

We use nuclear magnetic resonance (NMR) technique to study various quantum physical phenomena at low temperatures. In particular, we search for spin-triplet, topological superconductivity, and are interested in understanding the mechanism of superconductivity in various classes of materials including copper

oxides, iron pnictides, heavy fermion compounds, non-centrosymmetric materials. One of our current projects is on topological superconductors, whose surface states can be used for quantum computing. Here, the term "topological" means that the wave function describing superconductivity has a non-zero topological invariant, just as a donut where the number of hole is invariant against deformation.

Physics of Solid Surfaces and Interfaces

Functionalities of solid materials are studied from the viewpoint of electronic states. Experimental studies of electronic states lead to elucidating the origin and/or mechanism of the functionalities and also give the strategy to improve the functionalities in materials. Advanced electron spectroscopy techniques are employed to conduct the research for electronic states in materials in detail.

Researches of self-organized nanostructured thin films and development of new thin films with functionalities such as superconductivity and metal-insulator transition are performed. The physical properties of the films are investigated from the viewpoint of electronic states.

quantum spin system

High Energy Physics

Particle physics is the study of the properties of elementary particles, which are the smallest units that make up matter, and the forces (interactions) that connect them. Particle physics is also closely connected to understanding the universe. Our laboratory promotes experimental research through accelerator experiments and astrophysical observations. In particular, we focus on particles called neutrinos and are trying to elucidate their properties and

the mysteries of the universe through a variety of experiments.

Pattern Information Processing

The research area of Pattern Information Processing involves the study of fundamental theories and practical applications related to pattern recognition and understanding. It mainly focuses on visual information processing and language information processing. The research targets also include the extraction of distinctive patterns from data and the study of methods for analyzing, recognizing, and utilizing these patterns. In the field of pattern information science, we utilize techniques and algorithms from machine learning, statistics, artificial intelligence, and data mining to design appropriate feature representations and construct identification models for images and texts.

 programming learning/WLAN/multimedia/IoT application/distributed computing system

Optical and Electromagnetic Waves

Optical and Electromagnetic Waves (OEW) Lab studies research topics that aim to improve electrical, electronic, and telecommunication systems in speed and reliability. Our research is related to specific design technology to intentionally control and reduce unintentional electromagnetic waves, or electromagnetic noise, generated by electrical, electronic, and telecommunication equipment. Such design technology is called EMC design. EMC is short for electromagnetic compatibility

and means the ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable disturbance to anything in that environment. EMC consists of two aspects, EMI (electromagnetic interference) and EMS (electromagnetic susceptibility). The former is the ability that a system cannot interfere with other systems or subsystems. In contrast, the latter is the one that system must continue to operate correctly in the presence of interference from others or transient.

Prof. TOYOTA Yoshitaka

Research Themes
 Electromagnetic Compatibility (EMC)/Hardware Security/Safe and Security

Information Security

Consequently, securing and safeguarding communication and service delivery has become a critical issue.

In our research laboratory, we are committed to the research and development of cryptography, random number generation, and related technologies. Our goal is to ensure that internet-connected devices, such as medical devices, automobiles, and smart home appliances, can operate securely and safely in this changing scenario. By applying encryption and random number techniques, we aim to provide reliable solutions that safeguard sensitive data and prevent security threats. Our research explores enhancing encryption algorithms, producing high-quality random numbers, and designing secure communication protocols. Through these endeavors, we aspire to create a dependable environment where individuals and organizations can confidently use internet-connected devices without jeopardizing their security and privacy.
