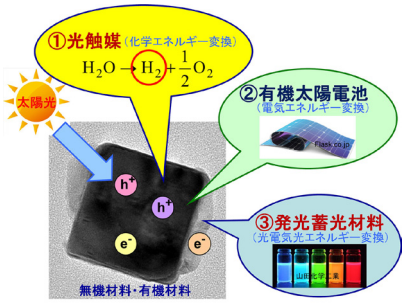
Surface Physical Chemistry



Photocatalysts have attracted considerable attention due to their potential applications for water-splitting to generate hydrogen gas by using solar energy. As H2 is clean and free from CO2 emissions, photocatalysts are expected to address many problems such as the energy crisis, environmental pollution, and global warming. However, the efficiency of photocatalysis is still not sufficient for industrial use; hence, further activity enhancement is required. The efficiency of photocatalysis is determined by the competition between electron-hole pair recombination and the rate of charge transfer to the reactant molecules. Therefore, we are studying the behaviors of photogenerated charge carriers to elucidate the mechanism. These researches should shed light on the development of highly efficient solar light driven water splitting photocatalysts.

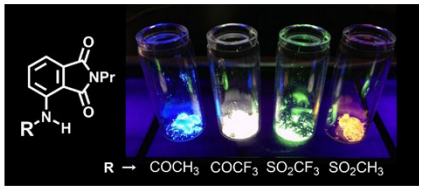
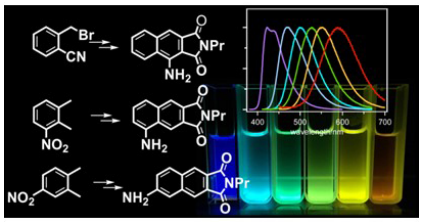
Photocatalysis/Solar cells/ Ultrafast laser spectroscopy/ Reaction dynamics

Synthetic and Physical Organic Chemistry





In Synthetic and Physical Organic Chemistry research area, we investigate organic photochemistry to develop novel functional molecule, such as luminescent materials organic semiconductors. Our research subjects are as follows.

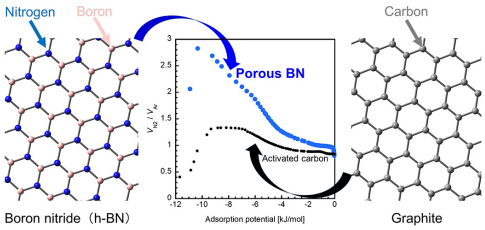
Assoc. Prof. OKAMOTO Hideki

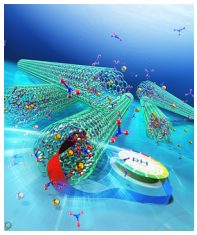
■Research Themes

Organic photochemistry/Organic functional molecule/Fluorescence/Polycyclic aromatic hydrocarbon/Organic semiconductor

Inorganic Chemistry

Since the adsorption of molecules and ions into solid pores proceeds spontaneously by selecting the appropriate material, so that the separation and purification process of mixtures can be constructed without any energy supply. We focus on fundamental phenomena to stabilize adsorbed species and to determine the ability. That can build design guidelines for inorganic porous materials that we should aim for in the next generation.





Prof. OHKUBO Takahiro

■Research Themes

Adsorption/Separation/Pore/ Nanocarbon/Porous ceramics

Nanochemistry

The aim of our research is to explore nanometrology by exploiting the novel functionality of inorganic nanomaterials. We are currently investigating nanoscale properties of biological samples and electronic devices, through optical responses of nanodiamonds and metallic nanoparticles.

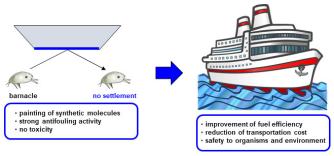
Organic Chemistry



Development of New Synthetic Reactions and Its Application to the Synthesis of Biologically Active Organic Compounds

Biologically active natural products have been regarded as the promising drug candidates and useful tool for life science. Particularly, because of their potent biological activities, natural products isolated from marine organisms have attracted much attention of organic chemists, biologists, and pharmacologists. We are studying the developing new synthetic reactions and its application to the total synthesis and structural elucidation of biologically active organic molecules such as marine toxins, antitumor, and antifouling compounds.

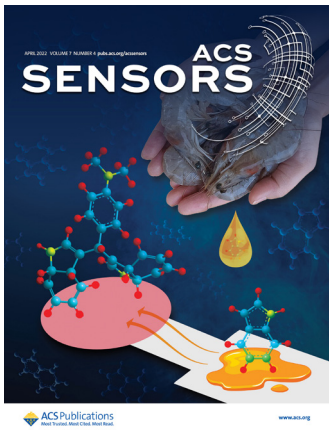
Analytical Chemistry



We are developing a high-performance separation and determination methods using a laser and simple chemical sensors using paper substrates. We are also developing analytical methods for vesicles released by biological cells, environmental pollutants, active components contained in food, and chemicals that serve as indicators of food degradation. We are also working on research on high-performance separation using capillary electrophoresis and new analytical methods with nanochannels.

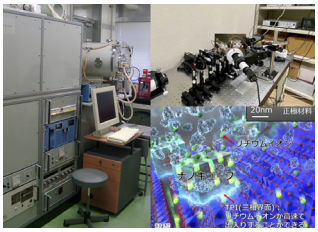
Solid State Chemistry



Research on the development of new functional ceramics (structural materials and electronic materials) and their application to various electronic elements and electrochemical devices has been carried out. Attempts have been made to fabricate ceramics using internal stress and interfaces between different substances, and to fabricate ceramic solids from liquid and gas phases. Attempts have also been made to fabricate ceramics using internal stress and interfaces between different materials, and to fabricate ceramic solids from liquid and gas phases. We comprehensively evaluate the effects of mechanical external force, electric field application as an external field, and electromagnetic wave irradiation on the electromagnetic properties of ceramics.

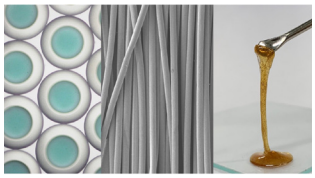
Interface Process Engineering



Under the catchphrase Process Innovation for Product Innovation, we study on the development of new materials and the proposal of new processes, using a chemical engineering approach that integrates a wide range of disciplines with interface as the keyword. We explore new manufacturing methods for functional materials based on polymer chemistry, biotechnology, organic chemistry, and microfluidics. Specifically, we fabricate functional soft materials including polymer particles, capsules, fibers, and gels.

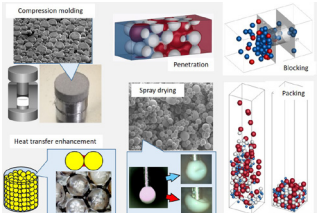
Fluid and Particle Process Engineering



In chemical processes for producing inorganic materials, organic materials, and polymer materials, particulate solid material so called "Powder" are used as intermediates and final products. Our research works are investigation and establishment for the designing and controlling methods of a series of processes from production to handling of particulate solid materials. Main topics are development of dry surface cleaning method, compression molding, powder property evaluation method, kneading, layer formation during drying, particle generation by spray drying as a process involving heat and mass transfer, gas-solid chemical heat storage. We are also conducting mesoscale numerical calculations of particle dispersion systems as basic research on interfacial phenomena and interactions between particles.

Bioprocess Engineering

Bioprocess engineering group is aiming to realize the industrial utilization of functional proteins: Proteins are often too unstable against dehydration, contact with a solid surface, etc., to be applied as therapeutic agent and sensing probe. We have been engaged in developing the technologies to maintain functional proteins against the loss of their structure and functionality due to dehydration and immobilization. Now, our research interests are expanded to solid dispersion of water-insoluble drugs, nano-spinning of edible polymers, protein immobilization with controlled orientation, etc.

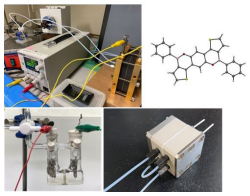
Synthetic Process Chemistry



We study innovative organic synthetic processes driven by organic electron transfer reactions. In these electrochemical methods, electricity is used as a driving force, enabling the greener chemical transformation without toxic and hazardous chemical reagents. Based on the electrochemical organic synthesis, we focus on developing novel chemical transformations for facile access to organic functional materials such as active materials for organic semiconductors and light-emitting materials, and biologically active compounds. Microflow reactions have attracted a great deal of attention in recent years, and we are also working to develop reactions that combine flow chemistry with electrochemical methods. The machine learning-assisted optimization of organic chemistry has also been investigated.

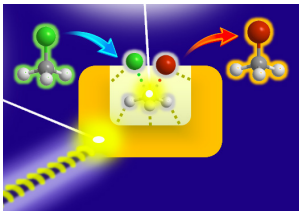
Synthetic Organic Chemistry



We develop catalysts and catalytic reactions for the chemical fixation of carbon dioxide (CO_2). CO_2 is not only a greenhouse gas but also a renewable carbon source, and CO_2 fixation is an important technology for the creation of carbon-neutral societies based on circular economy. On the other hand, fluorescent dyes and circularly polarized luminescence (CPL) dyes are expected to find various applications such as organic functional materials. We study these subjects taking advantage of organic synthesis.

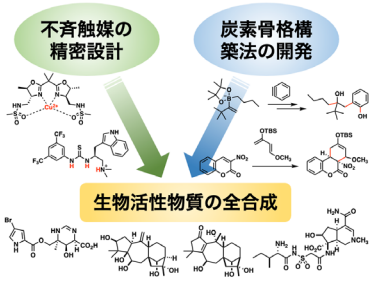
Bioorganic Chemistry



There have been obtained many natural organic compounds that exhibit unique biological activities. These bioactive substances are useful as pharmaceuticals and their lead compounds. We are developing methods for the chemical synthesis of these bioactive compounds with diverse functional groups and complex carbon skeletons. Considering the viewpoint of “clean,” that is environmentally benign, organic synthetic chemistry, we have been designing a catalyst system that can stereoselectively synthesize organic compounds with various functional groups, and have been developing carbon-carbon bond formation reactions that can construct complex carbon skeletons.

Industrial Catalysis

To promote research and technological development of innovative chemical catalytic methods of great industrial importance for solving global problems. Although the Faculty of Engineering of Okayama University was established with high expectations from the people of Okayama Prefecture, we recognize that our contribution to the local community is still far from sufficient, and we will promote practical application-oriented chemical research based on coordination chemistry to achieve harmony between the economy and the environment through down-to-earth regional and industry-academia collaboration. Through research and other activities, we aim to nurture proud Japanese people with a firm and unshakable core.

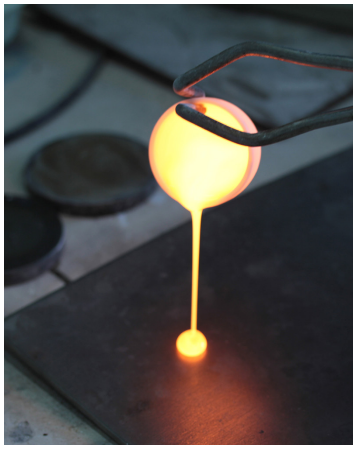
Environmental Amorphous Materials Science



Glass has excellent properties of transparency and moldability, which gives it various applications used in our daily life such as clear windows, containers, bottles, lens and fiber-form optics and so on. Another advantage of glass is its ability as a solvent, which allows it to dissolve and retain various elements including toxic and/or radioactive ones. Glass can be a key material to solve environmental and energy problems. In our group, we contribute to resource and energy saving through the research and development of functional glass and ceramic materials. We are also studying on efficient process of recycling inorganic wastes based on physics and chemistry of glass materials.

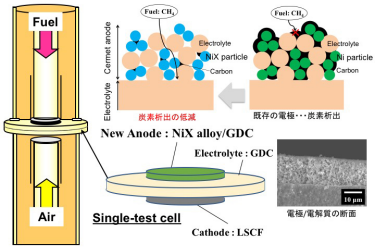
Environmental Inorganic Materials Science



We are developing novel electrode materials and electrolytes to enhance the performance of solid oxide fuel cells, which are gaining attention as a clean and efficient power generation system. Specifically, our focus lies on the utilization of biogas as a fuel. Additionally, we are working on the development of new separation materials that achieve efficient water/alcohol and oil/water separation with low energy consumption. This is accomplished by leveraging the unique pore structure of zeolites, the superhydrophilicity of titanium oxide photocatalysts, and the combination of hydrophilic and hydrophobic surfaces.

Environmental Process Engineering

In order to convert an unusable material to a valuable material, we research to propose an environmental-friendly chemical processes. We proposed the three chemical processes shown in the figure to produce a monomer to make a bioplastic from woody biomass. As the first process, we used subcritical water to hydolyze cellulose and hemicellulose. We converted monosaccharide to 2,5-Hydroxymethylfrufral (HMF) by the quick extraction as called as Slug Flow as the second process. We proposed a converting chemical process using a metal catalyst with liposome, which is an artificial cell membrane, to produce 2,5-frandicarboxylic acid.
