Geometry

Geometry is the study of figures, which are technically called manifolds.

Differential geometry is the field of the precise study of the shape of manifolds, using cues such as curvature and the behaviour of geodesics of (Riemannian) manifolds. Here geodesics are generalisations of straight lines in Euclidean space. On the other hand, topology is the field of the study of topological properties of manifolds by mapping algebraic invariants onto them.

The basic algebraic invariants, for instance, are fundamental groups, homotopy groups, homology groups and cohomology groups.

Mathematical Analysis

Taniguchi/Taguchi Group

Research Sector of Mathematical Analysis

- Nonlinear Partial Differential Equations (Prof. M. Taniguchi)
- Stochastic Differential Equations (Prof. D. Taguchi)

Prof. M. Taniguchi

Prof. D. Taguchi

Pyramidal traveling fronts and axially non-symmetric traveling fronts to the Allen—Cahn Equations (M. Taniguchi, SIAM J. Math. Anal. 2007, 2015, Memoirs of MSJ 2021)

Research Area “Mathematical Analysis” is devoted to theory on partial differential equations, theory of probability, functional analysis, dynamical systems and statistics.

For theory on partial differential equations, we study multi-dimensional traveling fronts appearing in reaction-diffusion models in physics, chemistry and biology. For theory of probability, we study stochastic partial differential equations and their discrete models.

Quantum Structural Physics in Correlated Matter

In recent years, it is known that topological insulators, topological semimetals, etc. undergo large physical property changes in small electric and magnetic fields, related to the even-oddity of wave functions and bands. However, its creation requires control of the Fermi surface, control of spin-orbit interaction, and control of space and time reversibility. We create and study pure topological materials by means of quantum structural physics.

Superconductivity

Low Temperature Condensed Matter Physics

We use nuclear magnetic resonance (NMR) technique to study various quantum physical phenomena at low temperatures. In particular, we search for spin-triplet, topological superconductivity, and are interested in understanding the mechanism of superconductivity in various classes of materials including copper

oxides, iron pnictides, heavy fermion compounds, non-centrosymmetric materials.

One of our current projects is on topological superconductors, whose surface states can be used for quantum computing. Here, the term "topological" means that the wave function describing superconductivity has a non-zero topological invariant, just as a donut where the number of hole is invariant against deformation.

Physics of Solid Surfaces and Interfaces

Functionalities of solid materials are studied from the viewpoint of electronic states. Experimental studies of electronic states lead to elucidating the origin and/or mechanism of the functionalities and also give the strategy to improve the functionalities in materials. Advanced electron spectroscopy techniques are employed to conduct the research for electronic states in materials in detail.

Researches of self-organized nanostructured thin films and development of new thin films with functionalities such as superconductivity and metal-insulator transition are performed. The physical properties of the films are investigated from the viewpoint of electronic states.

EMC Design

Optical and Electromagnetic Waves (OEW) Lab studies research topics that aim to improve electrical, electronic, and telecommunication systems in speed and reliability. Our research is related to specific design technology to intentionally control and reduce unintentional electromagnetic waves, or electromagnetic noise, generated by electrical, electronic, and telecommunication equipment. Such design technology is called EMC design. EMC is short for electromagnetic compatibility

and means the ability of an equipment or system to function satisfactorily in its electromagnetic environment without introducing intolerable disturbance to anything in that environment. EMC consists of two aspects, EMI (electromagnetic interference) and EMS (electromagnetic susceptibility). The former is the ability that a system cannot interfere with other systems or subsystems. In contrast, the latter is the one that system must continue to operate correctly in the presence of interference from others or transient.

Prof. TOYOTA Yoshitaka

Information Security

Consequently, securing and safeguarding communication and service delivery has become a critical issue.

In our research laboratory, we are committed to the research and development of cryptography, random number generation, and related technologies. Our goal is to ensure that internet-connected devices, such as medical devices, automobiles, and smart home appliances, can operate securely and safely in this changing scenario. By applying encryption and random number techniques, we aim to provide reliable solutions that safeguard sensitive data and prevent security threats. Our research explores enhancing encryption algorithms, producing high-quality random numbers, and designing secure communication protocols. Through these endeavors, we aspire to create a dependable environment where individuals and organizations can confidently use internet-connected devices without jeopardizing their security and privacy.

Machine Design and Tribology

In order to realize a carbon-neutral or decarbonized society, mechanical systems are required to be highly efficient, lightweight, and have a low environmental impact. At the mechanical design laboratory, we apply cutting-edge surface modification methods, coating methods and analysis methods to study technologies that dramatically improve the life, efficiency, and functionality of power transmission elements for EVs and various tribo-elements.

Nontraditional Machining

Along with the rapid progress of industrial technology, various new materials with excellent properties have been developed. Most of these materials are difficult to machine by the conventional mechanical methods, and the demand for machining of fine complicated shapes has been increased. Our laboratory is researching on high-performance and high-functional nontraditional machining methods, such as Electron Discharge Machining (EDM), Electron Beam Machining (EBM), and Laser Beam Machining (LBM) with using electric, electronic, optical energies. In addition, we are developing novel machining methods for the next generation.

Fluid Dynamics

Understanding and controlling the forces that an object receives from the air plays an important role in industrial products such as automobiles and airplanes. The Fluid Dynamics Laboratory conducts research on fluid dynamics with the aim of contributing to the improvement of the performance of current industrial products and the development of new products. The Fluid Dynamics Laboratory conducts research on relatively slow flows, such as those assumed for wind turbines and automobiles used in wind power generation, to fast flows that reproduce the flight environment of airplanes and rockets, based on experiments, numerical calculations, and AI techniques.

Wood-Based Materials

Although wood is a natural material with excellent mechanical properties, it has some weaknesses due to its biological origin. To overcome these weaknesses, previous researchers have developed various timber composite members and wood-based materials manufactured by gluing or connecting timber and small elements of wood. Now, to promote large-scale timber structure with a view to decarbonization, we will use the latest analytical and measurement techniques to provide theoretical support for fracture phenomena of existing wood-based materials and timber composite member; additionally, we will propose new combinations and forms of them on the basis of this analysis.

Asst. Prof. SUDO Ryutaro

■ **Research Themes**
Wood-Based Material/ Timber Engineering

Wood Resource Utilization

Wood is significantly different from other agricultural and marine products in that, with proper management, it can store carbon over the long term. Maximizing this capability could potentially help mitigate global warming. Our laboratory is working toward further mitigating global warming by recycling wood. Additionally, we are conducting research on the effective use of wood resources by combining recycled wood with adhesive technologies.

Prof. KORAI Hideaki

■ **Research Themes**
Wood resources/Wood-based materials/Wood adhesion/ Recycled wood/ Carbon storage

Urban and Building Environmental Engineering

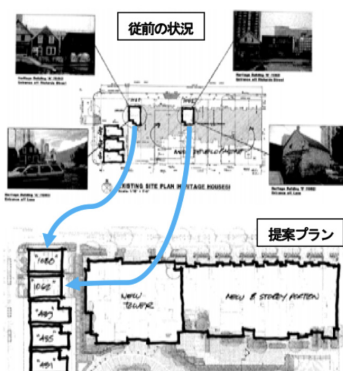

Energy is essential for maintaining human activity. However, consuming energy not only causes global environmental issues such as global warming and energy resource depletion, but also causes local (urban) environmental issues such as heat island phenomenon and air pollution. We have been researching in our laboratory to clarify the way urban structures and the related energy systems should be built in the near future in order to realize a comfortable urban environment while maintaining a sustainable earth.

Surface Physical Chemistry

Photocatalysts have attracted considerable attention due to their potential applications for water-splitting to generate hydrogen gas by using solar energy. As H_2 is clean and free from CO_2 emissions, photocatalysts are expected to address many problems such as the energy crisis, environmental pollution, and global warming. However, the efficiency of photocatalysis is still not sufficient for industrial use; hence, further activity enhancement is required. The efficiency of photocatalysis is determined by the competition between electron-hole pair recombination and the rate of charge transfer to the reactant molecules.

Therefore, we are studying the behaviors of photogenerated

charge carriers to elucidate the mechanism. These researches should shed light on the development of highly efficient solar light driven water splitting photocatalysts.

Industrial Catalysis

To promote research and technological development of innovative chemical catalytic methods of great industrial importance for solving global problems. Although the Faculty of Engineering of Okayama University was established with high expectations from the people of Okayama Prefecture, we recognize that our contribution to the local community is still far from sufficient, and we will promote practical application-oriented chemical research based on coordination chemistry to achieve harmony between the economy and the environment through down-to-earth regional and industry-academia collaboration.

Through research and other activities, we aim to nurture proud Japanese people with a firm and unshakable core.

Applied Ecology

In the last few decades, biodiversity loss has been a big issue all over the world. As you know, human activities are one of the most primary factors, which modify the natural habitats of animal and plant species, cause the decline of their population, and sometimes completely make them extinct. To live as a well-behaved passenger on the future earth, we first need to understand the relationship between biodiversity and human activities. In our laboratory, we study for and actually perform for conservation and appropriate management of biodiversity. And, we believe these should be done based on accurate knowledge about biology, ecology, and environmental science. We are targeting various taxa, such as endangered fishes, invasive crustaceans, and native herbaceous plants.

Soil Management

Agriculture is responsible for emissions of greenhouse gases (GHGs) such as carbon dioxide (CO_2), nitrous oxide (N_2O), and methane (CH_4). Production of these gases in farmland soil results from biological processes like organic matter decomposition, nitrification and denitrification, and highly depends on organic matter inputs. We aim at analyzing the effects of organic matter amendment on GHGs emissions. In particular, we are interested in agricultural soil amended with livestock compost.

Prof. MAEDA Morihiro

■ **Research Themes**

Greenhouse gases/Nitrogen/Phosphorus/Sediment/Soil/Organic waste/Water

Agricultural Land Engineering

In today's global society, where the effects of climate change are becoming increasingly severe, agricultural land, as a production base, is expected to contribute to mitigation and adaptation for climate change through rainwater recharge, organic matter conservation, and greenhouse gas reduction, while producing food in a sustainable and stable manner. Therefore, we are conducting research on management methods of agricultural land through investigation, experimentation, monitoring, and prediction of soil, water, chemicals, and atmospheric environments at multi-layered spatial scales from the earth to the arable land.

Conservation of Aquatic Biodiversity

Molluscs including shellfish, snails, slugs and so on are a very diversified animal group and consist of more than 80,000 Recent species in the world, but their taxonomy and recognition of species are still poorly understood. For example, *Turbo sazae* is one of the most well-known marine snails in Japan since ancient age, but nevertheless the species has long been misidentified with *Turbo cornutus*, a species endemic to China, until recently and documented to be unnamed in 2017. Another edible species *Tegula kusairo* exhibited the similar case and it was described as a new species in 2020. Furthermore, many species become extinct or critically endangered by artificial environmental changes before recognizing their presences by human beings. The alpha-taxonomy of this group is thus highly important and an urgent matter in terms of biodiversity conservation.

Food and Environmental Policy

Toward the "Asian Ways" of Sustainable Development: Viewing Our Food and Environment from Social, Political, and Economic Perspectives
Social sciences and humanities (SSH) can contribute to solving food and environmental problems. We are especially employing area studies/political and economic perspectives to broadly re-examine these issues in Asia, such as agriculture, resource industries, environmental policies, community-based development, disaster management, etc. The 21st century is believed to be the Asian century. The future of our world thus largely rests on how Asia commits to sustainability. Based on domestic, foreign, and international research from Asia and other regions, we wish to examine changes in human-nature relationships and the balance between development and the environment.

Food Chemical Biology (Biological and physiological functions of food phytochemicals)/Functional Mechanism and Bioavailability of Food Factors

Chemistry of Bio-signalling

In particular, our research focuses on stress signaling regulating stomatal movement. Stomatal pores, which are formed by pairs of guard cells in the epidermis especially of leaves, regulate gas exchange for photosynthesis and transpirational water loss. Guard cells can perceive various stimuli such as light, CO₂, pathogen infection, and various phytohormones such as abscisic acid, then transducing the inputs to a change in stomatal aperture. Using multidisciplinary approaches, we aim to reveal the detailed mechanisms of signaling cascading from stress sensing to stomatal aperture regulation in guard cells. We also study the basic mechanisms of heavy metal and salt stress responses in plants using model plants as well as cultured cells. Our research advance will contribute to develop new technologies that improve crop productivity and safety.

Plant Genetics and Physiology

Our life on earth cannot continue without the atmospheric environment, which is maintained by oxygenic photosynthesis. Plants perform photosynthesis in chloroplasts, where light energy is converted into chemical energy by a series of electrochemical reactions. In contrast, land plants are exposed incessantly to excess light energy or harsh atmospheric environments that engender 'photodamage'. How do plants cope with such photosynthetic inactivation? What are the key elements to maintaining or even maximizing chloroplast functions? Our group studies various aspects of chloroplast development and photosynthesis. By understanding the factors involved in photoprotection and chloroplast function, we aim to improve crop productivity against atmospheric stress over the long term.

Signaling Mechanisms

Did you know that plants, despite being rooted in one spot, are actually quite adaptable to changes in their environment? It's fascinating to think about how they sense and respond to these changes without having a nervous system or brain like animals do. This is a question that scientists are still trying to answer. Our research group is specifically investigating how plants integrate and analyze environmental information, even at the tissue level, to determine the best response as individuals. We're focusing on plant hormone responses and chromatin regulation, using techniques like physiological and molecular biology, as well as molecular genetics. Our ultimate goal is to apply this knowledge to develop stress-tolerant crops that can thrive even in challenging conditions. By understanding how plants handle environmental stress, we can help create a more sustainable and resilient food supply for the future.

Plant Cytomolecular Biochemistry

Plants are sensitive to various environmental stimuli. They respond to physical, chemical, and biological stress factors. Consequently, plants can undergo changes in their development, morphology, and physiology during their life cycle. We have used biochemical and molecular biological techniques to elucidate the functions of enzymes, proteins, and gene regulating factors, which are all related to stress tolerance mechanisms of plant cells under environmental stress conditions. Through our research, we aim at developing plants that can adapt well to adverse and extreme environments to resolve difficulties such as food shortages and environmental degradation.

Plant Stress Responses

Since plants cannot move, they must cope with various environmental stresses. In our group, we are focusing on "mineral stress" including deficiency of essential nutrients or excess of toxic and essential elements. We are working on the identification of transporters involved in the uptake, root-to-shoot translocation, and distribution/redistribution of different mineral elements mainly in rice, and on the regulatory mechanisms of these transporters in response to environmental changes. Our goal is to improve the productivity and safety of crops through the manipulation of transporters.

Molecular Virology

Plant growth is influenced by various microorganisms including both beneficial and harmful ones. Among them are plant-infecting viruses that cause serious damage to crops and mycoviruses infecting phytopathogenic fungi that serve as biocontrol (virocontrol agents). Also, an increasing number of bacteria and fungi mutualistic to plants that enhance plant growth and stress tolerance. This group is mainly engaged in the three projects below.

Plant-Insect Interactions

Establishment of effective plant defense systems against herbivores in natural history reflects the existence of extremely variable interactions between plants and insects, also known as co-evolution process. Our group strives to understand, at a molecular level, the mechanisms of activation, signal transduction and metabolic basics of plant defenses triggered after the recognition of insect attack. Furthermore, we target sustainable pest control by the use of natural enemies and their attraction to herbivore-infested plants by the emissions of various volatile organic compounds (VOCs) from plants.

Plant-Environmental Microbiology

By understanding the ecology of Methylobacterium species, which utilize methanol released by plants and dominate on leaves, we will apply their function as growth-promoting bacteria to agriculture. We are also analyzing the rhizosphere microbial community structure in crop ecosystems. On the other hand, we are trying to uncover the mechanism of growth and mortality of bloom-forming phytoplankton, which cause damage to fisheries, by focusing on symbiotic bacteria.

Plant-Pathogen Interactions

Rice is the world's most important crop, and improving rice is an important research challenge.

Our ultimate goal is to design new rice varieties that exhibit resilience against abiotic stresses while augmenting essential agronomic traits. To achieve this ambitious goal, we investigate immunoreceptors and the small G protein OsRac1, both of which play pivotal roles in rice immunity. We firmly believe that we can successfully engineer a robust rice immune system by acquiring a comprehensive understanding of the functions performed by immunoreceptors and OsRac1.

Plant Functional Genomics

Barley, the fourth most important cereal crop in the world, typically has seeds with adhered hulls. This hulled seed trait is suitable for breweries. Some naked seed mutants with easily separable hulls were generated through spontaneous mutation. They are suitable for food usage. We have revealed that barley awns and spike hulls are photosynthetically active. Our current research specifically examines molecular identification and characterization of beneficial genes controlling (1) seed morphology and quality, including water soluble healthy dietary fiber, and (2) photosynthetic contribution of awns and hulls by using mutants. We seek application of our basic findings to practical breeding.

Plant Diversity Analysis

We conserve and evaluate barley genetic resources (varieties and lines) collected from all over the world. These genetic resources vary in characteristics depending on the location of collection and purpose of use, for example, there are regional differences in vernalization requirements (the degree of low-temperature exposure required for flowering).

Based on our evaluation of genetic resources, we carry out genetic analysis, gene isolation, and functional analysis of stress tolerance, such as grain dormancy and disease resistance, for application use.

Integrated Genomic Breeding

Rice is cultivated globally and exhibits a wide range of phenotypic variations resulting from genetic diversity. These variations serve as valuable genetic resources for enhancing rice plants to meet human needs. Although many of these traits are governed by numerous genes, the genetic foundations and biological functions of the majority remain largely unknown, hindering their practical application. To address this, we leverage useful phenotypic variations from diverse rice germplasms and identify the underlying genes by combining recent advancements in genomics and bioinformatics. Our efforts are focused on developing new breeding materials and proposing more effective breeding methodologies.

Plant Genome Dynamics Analysis

Our laboratory conducts genetic and breeding research on sweetpotato. Using a Next Generation Sequencer (hereinafter referred to as NGS) that outputs a huge amount of DNA sequence data, we are working on the development of DNA markers and gene identification related to important agricultural traits such as disease and pest resistance and yield. We are also conducting gene expression analysis (Iso-Seq, RNA-seq analysis, etc.) to elucidate the mechanism of disease resistance, and also developing novel genotyping systems applicable to polyploid crop species.

Plant Pathology

The Food and Agriculture Organization (FAO) reports that over 850 million people face insufficient access to food, and an estimated 24,000 people succumb to hunger daily. Given that plant diseases cause annual yield losses of up to 20% in food and cash crops, continuous improvement and advancement of pest management systems is essential to sustainably feed a growing world population. To achieve this goal, we focus on elucidating the molecular mechanisms that govern plant immunity and pathogen virulence, and on innovating new technologies to control plant diseases.

Vegetable Crop Science

Investigation of physiological characteristics related to vegetable production and development of production systems

We are conducting research on vegetable production, such as tomatoes and strawberries, from the perspective of how the growing environment affects crop quality, yield and other agricultural traits. Recently, we especially focus on efficient environmental control in greenhouse cultivation and pollination control in strawberry production.

Another research theme is the use of the flowering hormone (florigen) in vegetable production and breeding. We are conducting basic research and developing technologies to efficiently deliver florigen using grafting for cruciferous vegetables such as cabbage and radish.

We are also carrying out various other studies on vegetables, such as the evaluation of quality characteristics of traditional vegetables, the development of efficient watering technology in cucumber cultivation, and the development of vapor pressure deficit (VPD) control methods in the cultivation of melons and eggplants.

Crop Science

Environmental destruction is progressing now at an unprecedented scale, in the form of global warming and accompanying desertification, salt accumulation in soil, depletion of water resources, and so on. On the other hand, the human population continues to increase, and there is strong demand for expansion of food production. Therefore, in addition to improving the grain yield in arable land suitable for

cultivation, production of agricultural crops is necessary even in inadequate lands affected by water shortage, salt accumulation etc. In this field we conduct physiological and ecological research and education concerning various crops for the purpose of improving crop production under defective environmental conditions.

Animal Breeding and Genetics

The aim of animal breeding and genetics is to investigate invisible genetic events using statistical and molecular genetics analysis. In particular, we are interested in genetic evaluation using genomic information and the genetic diversity in the animal population. Through our research activity, young scientists are encouraged to acquire the necessary knowledge and techniques to pursue scientific careers in quantitative genetics in the post-genome era. Additionally, we are studying the effects of pre-slaughter fasting stress on meat quality and skeletal muscle protein degradation. By accurately estimating the genetic traits of animals and elucidating the mechanisms by which stress impacts productivity, we strive to optimize animal production systems.

Animal Nutrition and Feed Science

Nutrition is the study of a series of biological processes necessary for life. The goal of nutrition study is to improve human health and quality of life. Animal nutrition is a field that has been expanded to include animals. In our laboratory, we are doing research using a variety of animals, i.e., model animals, food-producing animals (livestock), wild animals, and companion animals. The research using model animals aims to clarify biochemical and physiological mechanisms associated with nutrition and metabolism. The members working on the projects use model animals and cultured cells for functional analyses of food. Several students work on food processing and its control. They are examining the characteristics of microorganisms involved in fermentation to improve the safety and value of food and feed. Our goal is to solve problems in the industries, clarify the functions of food and feed, and achieve technological innovation related to nutrition, metabolism, and health.
